

Abstract

An interlabial pad individual wrapping container is presented which facilitates sanitarily fixing and unfixing an interlabial pad between the labia of a wearer. The interlabial individual wrapping container can be used as a preferred handling member at the time of fixing or unfixing the interlabial pad. Two fingers of the left hand are inserted in the finger insertion openings formed from the belt body attached on the wrapping container; the wrapping container is separated into the sections and along the separation part by opening these fingers to the left and right; and in this state as it is, the action for fixing the interlabial pad held on a finger of the right hand is performed.
